

On-call rotations people can survive

Rotation design is a staffing problem,
not a goodwill problem.

PRESENTER • TEAM

No sourced figures: shift hours, page rates and roster sizes are unsourced.

One shift. Two handovers.

A rota is a staffing decision

1 Shift length

How long one person is reachable.

2 Handover

What moves at the change of shift.

3 Compensation

What the hours cost to schedule.

4 A ceiling on night pages

A limit the rota may not exceed.

Encouragement moves none of them. Only the roster does.

No sourced figures: shift hours, page rates and roster sizes are unsourced.

What a handover has to carry

THE PAYLOAD

Open incidents and the live hypothesis

What was tried and already ruled out

What is silenced, and when it returns

What is degraded but not yet paging

Who has been woken, and how often

WHY IT CANNOT WAIT

**The person leaving the shift
is the one who knows.**

The events are in the dashboard.
The reasoning is in the head of the
person going to bed.

So the handover is work inside the
shift, not a note sent after it.

What a page ceiling forces upstream

A ceiling does not reduce pages. It converts them into scheduled work.

A breach becomes an engineering ticket, not a personal apology.

An alert that cannot live under the ceiling is deleted or moved to daytime.

A system that only survives because someone is awake finally gets its fix.

No sourced figures: shift hours, page rates and roster sizes are unsourced.

What we need to decide

DECISION ONE

What is the minimum roster?

The size below which shift length, handover, pay and the night ceiling cannot all hold at once.

DECISION TWO

What do we give up below it?

Name the lever we suspend, for how long, and what pulls it back — before the rota picks for us.

Below the floor, something is given up — chosen or not.
