

MLOps Platform Roadmap

What to build first, what to buy,
and what to stop each phase on.

PREPARED BY	DATE	AUDIENCE
PRESENTER · TEAM	2026.08	PLATFORM & ML LEADS

The problem is usually not MLOps — it is repeatability

01

Training lives in notebooks

The run that produced the model in production cannot be reproduced.

02

Deployment is a person

One engineer ships every model, and the steps live in their head.

03

Retraining is a memory

Nobody can say when a model was last refreshed, or on what data.

04

Nobody owns the boundary

Data platform and ML team each assume the other handles features.

None of these is fixed by a tool. They are fixed by making one path the only path.

A platform owns six capabilities; a project owns none of them

01

Data & features

One definition, same in training and serving.

02

Training

Every model comes from a pipeline that can re-run.

03

Registry

A model has a version, a lineage and an owner.

04

Serving

Shipping a model is a config change, not a project.

05

Monitoring

Inputs, outputs and drift are visible on demand.

06

Governance

What a model trained on is answerable months later.

SEQUENCE

Three phases, each stopped by a criterion, not a date

Phases are gates, not calendar quarters — no dates appear here because none can be sourced.

Buy the undifferentiated layers; build only your differentiator

CAPABILITY	DEFAULT POSTURE	BUILD ONLY IF
Data & features	Buy or adopt	Your features are the product
Training	Adopt a standard runner	Training itself is your research
Registry	Buy	Never
Serving	Buy	Latency or hardware is the differentiator
Monitoring	Buy, then extend	Your drift definition is domain-specific
Governance	Adopt the company standard	Never — inherit it

DECISIONS

Decide four things before phase 1, or phase 2 will decide them for you

01

Who owns the boundary with the data platform

Left open: features get built twice, differently.

02

What the exit criterion for each phase is

Left open: phase 1 never ends.

03

What you will not build

Left open: the platform grows a bespoke everything.

04

Who the first internal customer is

Left open: the platform is designed for nobody.

DISCUSSION

What we need to agree on before the first phase starts

01 Which capability is actually blocking us today?

02 What is our exit criterion for phase 1, in one sentence?

03 Which layer are we genuinely differentiated in?

Thank you
