

The registry is the record of what is allowed to run — and of who said so.

PREPARED BY PRESENTER · TEAM	DATE 2026.08	APPLIES TO ALL REGISTERED MODELS
--	------------------------------------	--

What the registry is the record of

	FIELD	WHAT IT ANSWERS	WHO WRITES IT
A1	Version	Which artifact is this, exactly?	CI pipeline
A2	Lineage	What data and code produced it?	Training job
A3	Owner	Who owns it in production?	Registering team
A4	Stage	Where is it allowed to run?	Promotion workflow

A field nobody writes is a field nobody can trust.

How a model moves through the registry

STAGE · ENTRY REQUIREMENT · WHO SIGNS NO STEP IS SKIPPED

01	REGISTERED	An artifact exists with a version and lineage.	Automatic
02	STAGING	An evaluation report is attached and reviewed.	Model owner
03	PRODUCTION	A rollback target is named and on-call is told.	Owner + service
04	ARCHIVED	Superseded or withdrawn, with the reason recorded.	Model owner

A stage is a permission, not a label — the ledger records who granted it.

Four rules that keep the ledger trustworthy

	RULE	WHAT IT SAYS	WHAT BREAKS WITHOUT IT
R-01	One name, one lineage	A name never changes meaning.	Two teams ship different things under one name.
R-02	Deprecate before delete	Archived records stay readable.	An audit cannot reconstruct last quarter.
R-03	Production names its rollback	The previous version stays promotable.	Rollback becomes a rebuild.
R-04	Stage changes append	The ledger is never edited in place.	Nobody can say who promoted what.

What we still have to settle

Q1	Who signs a production promotion when the owner is away?
Q2	How long does an archived model stay readable?
Q3	What happens to a model whose owning team is dissolved?

Thank you
